

My name is Pedro. I was born in Brazil and have an academic and professional background that combines computer networks, software engineering, distributed systems and telecommunications. I hold a bachelor's degree and a master's degree in Computer Science from the Federal University of Uberlândia and a PhD in Computer Science from the University of Campinas, also known as UNICAMP. During my academic career, I worked primarily with cellular networks, Software-Defined Networks (SDN) and Network Function Virtualization (NFV).

I have experience in both academia and industry. I worked at Loggi as a software engineer, where I contributed to software systems used in a large-scale logistics environment. This experience strengthened my understanding of backend development, distributed systems, production software, code quality, system reliability, troubleshooting, and collaboration within engineering teams. My industry experience is important because it complements my academic background and gives me a practical perspective on how systems are designed, deployed, maintained, and improved under real operational constraints.

I later worked at the Singapore Institute of Technology, or SIT, as a Research Fellow and system engineer in a 5G applied research laboratory. In this role, I participated in the design, integration, deployment, testing, operation, validation, and troubleshooting of traditional and multi-vendor Open RAN-based private 5G networks. I also acted as a technical interface between SIT and external system integrators, helping coordinate deployment activities, resolve integration issues, execute acceptance tests, document results, and support end-to-end validation.

One of my major projects involved comparing the performance of a traditional single-vendor 5G RAN with a multi-vendor Open RAN system. The work included controlled downlink and uplink experiments under ideal and fading channel conditions, tests with single and multiple user devices and evaluation of metrics such as SINR, MCS, BLER, and application performance.

I am currently exploring career opportunities related to AI engineering, AI agents, applied AI, fundamental and applied research, software

engineering, platform engineering, infrastructure engineering, 5G, Open RAN, RIC. My transition toward AI engineering builds on my previous experience rather than replacing it. My software engineering background helps me build maintainable applications, while my research and system engineering experience helps me work with uncertain requirements, experimental systems, complex integrations, performance evaluation, and technical investigation.

Outside my professional activities, I like to explore nature, practice sports, learn about different kinds of technology, and study languages. I enjoy learning broadly and understanding how different systems, cultures, and technologies work. My favorite food is pizza, and my favorite movie is The Lord of the Rings.
